UK Biobank Built Environment Project - UKB Wales

# MORPHOMETRIC ANALYSIS OF THE BUILT ENVIRONMENT IN UK BIOBANK: DATA ANALYSES AND SPECIFICATION MANUAL 

Chinmoy Sarkar, John Gallacher, Chris Webster
Cardiff University
January 2014

## 1. INTRODUCTION

In the recent years, one of the primary emergent paradigms in the study of contextual health variations has been the influence of accessibility to health-promoting community resources upon an individual's health ${ }^{1}$. Accessibility in an urban activity space may be defined as the relative ease with which goods, services, activities and, generally destinations' or 'opportunities' can be reached from a given origin, essentially the dwelling location of an individual ${ }^{2}$. Several studies have highlighted the associations between health and access to health-promoting community resources, including: green spaces and recreational facilities ${ }^{3-7}$; retail ${ }^{8-12}$; transit stops ${ }^{13-15}$; supermarkets ${ }^{16-18}$; sports facilities ${ }^{19,20}$; community services ${ }^{21,22}$; and health care facilities ${ }^{23,24}$. Health effects of land use mix have also been highlighted ${ }^{10,25-27}$. Others have considered the health effects of street level physical accessibility ${ }^{28}$ as well as combination of land use and street level physical accessibility in an urban space ${ }^{29,30}$. Inhibitory health effects of specific land use destinations have also been studies, including fast food outlets ${ }^{31-33}$ the density of alcohol outlets ${ }^{34,35}$.

Nonetheless in most built environment - health studies, robustness and reliability of the strength and significance of associations are limited by small sample size and cross sectional design. Lack of prospective health and built environment datasets imply that the impacts of sustained exposures to the built environment cannot be predicted with a significant degree of certainty. Unravelling causality may further be impeded by selective migration, lack of statistical power, limited ability to adjust for confounding variables as well as the confusion between mediating versus confounding effects ${ }^{1,36,37}$. Large-scale prospective gene-environment studies provide the most practical solution to such methodological constraints. They have the ability to produce more reliable assessment of the health-impacts of sustained environmental exposures, both in terms of significant increments in explanatory power as well as causal inference ${ }^{38,39}$. The UK Biobank is such a flagship epidemiology program collecting prospective data on individual health, lifestyle and behavioural for half a million participants, aged 40-69 years and residing in any of the 21 major cities of UK ${ }^{40-42}$. The aim of the UK Biobank Built Environment project is objective assessment of the built environment (OABE) around the immediate neighbourhood of 500,000 participants of the UK Biobank cohort. This will result in the modelling, compilation and linkage of corresponding longitudinal spatial database of built environment with the UK Biobank health datasets. The large-scale automation of such detailed and precise measures of individual-level built environment morphological metrics (morphometrics) will have the potential to unravel the black box of causality, the pathways through which built environment in conjunction with the social and natural environment act as one of fundamental determinants of individual behaviour, physical and mental health. OABE of UK Biobank can thus
produce a comprehensive evidence-base on the impact of BE on lifestyle, behaviour and thereby health and hence, guide preventive intervention strategies as well as policy formulation.

## 2. BUILT ENVIRONMENT DATA SOURCE

### 2.1 UK Ordnance Survey dataset:

The Topography Layer and the Integrated Transport Network (ITN) Layer from the UK Ordnance Survey MasterMap (OSM) data as well as the UK Ordnance Survey Address Base Premium data constituted the base for the development of a series morphometrics. The OSM Topography Layer contains information on detailed surface features of the landscape categorized under nine themes (buildings, roads, tracks and paths, rail, water, terrain and height, heritage and antiques, structures and administrative boundaries). The Address Base Premium data provides the most detailed view of an address and its life cycle. It comprises of local authority, Ordnance Survey and Royal Mail addresses, current (approved) addresses, and alternatives for current addresses (reflecting differences in versions of addresses in current use), provisional addresses (proposed planning developments) and historic information for each address, where available, plus OWPAs and cross references to the OS MasterMap layer's TOIDs. The licence for the UK-wide Address Base Premium data procured from UK Ordnance survey comprised approximately 36 million valid address point features with an uncompressed file size of 29 GB. The component layers of the Address Base Premium data were joined together through the unique field - Unique Property Reference Number (UPRN). Thereafter, the geo-referenced grid coordinates; land use classifications and full address for each valid address points surveyed were extracted ${ }^{43,44}$. The same land use classification scheme as employed by the Ordnance Survey AddressBase Premium has been used in the present UK Biobank Built Environment project ${ }^{45}$. The polygon-based OSM Topography Layer and Address Base Premium were connected together through a spatial GIS queries. The OSM ITN Layer provides a topologically structured representation of the road network with respect to geometry of road links, road type (expressed in terms of motorway, A road, alleyway, etc.), junctions, grade separation, road names and numbers and information about the nature of road the link represents (for example single carriageway, dual carriageway or slip road). Geometric information consists of the length of the link as well as references to the node features at the ends of it. The OSM ITN Layer was subjected to network analysis techniques to evaluate the topological accessibility indices of the street network.

### 2.2 National Public Transport Access Nodes dataset:

Data on bus stops were obtained from the National Public Transport Access Nodes (NaPTAN) dataset ${ }^{46}$. NaPTAN forms a core component of the GB national transport information infrastructure
and is used by a number of other UK standards and information systems. Every GB station, coach terminus, airport, ferry terminal, bus stop, etc., is allocated at least one identifier code.

### 2.3 Digital Terrain Model data:

5-metre resolution digital terrain model licensed by Blue Sky was procured from LandMap Services of MIMAS at The University of Manchester (www.landmap.ac.uk/index.php/Datasets/BlueskyDTM/). The individual $100 \times 100 \mathrm{KM}^{2}$ image chunks were mosaicked together and the coverage of study areas of interest were extracted. This formed the basis for the analysis of terrain slope.

### 2.4 Ariel photographs:

0.5-metre resolution Colour Infrared Image (CIR) licensed by Blue Sky was procured from LandMap Services of MIMAS at The University of Manchester (www.landmap.ac.uk/index.php/Datasets/Colour-Infrared/) . The imaged were captured using one of two instruments Vexel UltraCams, and ADS40 from Leica Geosystems GIS \& Mapping, LLC. The individual 1X1 KM ${ }^{2}$ image chunks were mosaicked together and the coverage of study areas of interest were extracted. CIR captures the solar reflectance in three wavelength bands, namely red, green and near infrared bands of the electromagnetic spectrum. CIR was employed to calculate the index of greenery.

### 2.5 Area-level deprivation data:

Data on Welsh Index of Multiple Deprivation (WIMD) scores of 2008 and 2011 releases measured at the level of lower super output areas were downloaded from the STATWALES website (https://statswales.wales.gov.uk/Catalogue/Community-Safety-and-Social Inclusion/Welsh-Index-of-Multiple-Deprivation).

### 2.6 Building class data:

Cities Revealed building class dataset (version 6 for September 2012) comprising of information on residential dwelling types including the age of the dwelling and structural type was obtained in the form of $100 \times 100 \mathrm{KM}^{2}$ from LandMap Services of MIMAS at The University of Manchester http://www.landmap.ac.uk/index.php/Datasets/Building Class/Download-Building-Class-100km-x100 km .

## 3. GEOCODING INDIVIDUAL RESPONDENTS DWELLING ADDRESS

The UK Biobank Wales comprised of three assessment centres based in Cardiff, Swansea and Wrexham comprising of 20,816 active participants. The residential address of the participants were geocoded and $\mathrm{X}, \mathrm{Y}$ coordinates were extracted by matching the Biobank address data with the UK Ordnance Survey address datasets. All spatial analyses in the study employed the British National Grid (i.e. OSBS1936) projection system. $96.81 \%$ of all Welsh Biobank addresses of participants from the three assessment centres could be geocoded by employing this process ( $\mathrm{N}=20,152$ ).

## Deliverable file 1:

| File Name (size) | Description |
| :--- | :--- |
| Wales_UKB.csv (1.75 MB) | UK Biobank addresses file with geocoded and X, Y <br> coordinates in British National Grid appended to it. |

Table 1: Description of variables used

| Column No. | Variable | Description |
| :---: | :---: | :---: |
| 1 | Encoded anonymised participant ID | Unique ID |
| 2 | Date of attending assessment centre |  |
| 3 | UK Biobank assessment centre | UKB assessment centre |
| 4 | Address line 1 | Address fields provided by UK Biobank |
| 5 | Address line 2 |  |
| 6 | Address line 3 |  |
| 7 | Address line 4 |  |
| 8 | Address line 5 |  |
| 9 | Postcode |  |
| 10 | X_coordinate | Geocoded and X coordinate in British National Grid |
| 11 | Y_coordinate | Geocoded and Y coordinate in British National Grid |

## 4. BUILT ENVIRONMENT MORPHOMETRICS CONSTRUCTION

The built environment was measured within a pre-defined street network catchment buffers around an UK Biobank participant's dwelling unit. The focus has been solely on objective measurements of built environment rather than on the individual's perceptual information.

### 4.1 Land Use Morphometrics

### 4.1.1 Land use density

Given the epidemiological evidence of a significant relationship between density of health promoting/inhibiting land uses and multiple health outcomes, density was measured within $0.5,1.0$, 1.5, 2.0 kilometre street network catchments of UK Biobank respondent's dwelling as well as within the lower super output areas in which they resided. ArcGIS 10.2 Network Analyst was used to create street network catchment areas were created around the geocoded residences of UK Biobank participants. The UK Office of National Statistics has defined Lower Super Output Areas (LSOAs) as relatively stable, compact geographical units with reasonable degrees of homogeneity in shape and social composition and an average population of 1600 persons for Wales. This was also considered as one of the five definitions of neighbourhood. The LSOA boundaries for the present analysis were downloaded from the Office of National Statistics website. The 20,152 UK Biobank participants were distributed across 760 LSOAs of Wales. Density of more than 200 categories of land uses were calculated through a series of GIS queries from the from the AddressBase Premium dataset as the number of features of a specific land use category within a pre-defined neighbourhood and expressed as number of features per square kilometre of neighbourhood.

## Deliverable files 2a-2e:

| File Name (size) | Description |
| :---: | :---: |
| Wales_UKB_LU_Density_LSOAs.csv (13.6 MB) | Density of land uses within LSOA in which the UK Biobank participant resides |
| Wales_UKB_LU_Density_Netbuf500m.csv (11.9 MB) | Density of land uses within 500 metres street catchment area from the UK Biobank participant's residence |
| Wales_UKB_LU_Density_Netbuf1000m.csv (15.2 MB) | Density of land uses within 1000 metres street catchment area from the UK Biobank participant's residence |
| Wales_UKB_LU_Density_Netbuf1500m.csv (18.2 MB) | Density of land uses within 1500 metres street catchment area from the UK Biobank participant's residence |
| Wales_UKB_LU_Density_Netbuf2000m.csv (20.8 MB) | Density of land uses within 2000 metres street catchment area from the UK Biobank participant's residence |

## Header file name:

Wales_UKB_LU_Density_Header.csv (2.67 KB)

Table 2: Description of variables used for calculation of land use density

| Column No. | Variable | Component AddressBase Premium land use description ${ }^{45}$ |  |  |  |  |  |  |  |  |  |

### 4.1.2 Health specific destination accessibility

Walkable destinations having the propensity to influence health in a specific way were parameterized in the present study in the form of network distance from a respondent's dwelling to the nearest destination. Network proximity was used as opposed to the conventional Euclidean/airline distance, as it provides a more accurate behavioural measurement of accessibility. Street network distance (in metres) was calculated using 'closest facility analysis' in Network Analyst, ArcGIS 10.2. In the case of parks (land use code LP) which is a larger destination occupying a significant area, multiple entry points of access were manually digitized after overlaying it on the 0.5 meter resolution colour infrared image of the area of interest. However, in the case of building destinations, a single point was employed as the location of the facility. 39 different health promoting/inhibiting land use destinations were used in the present study.

## Deliverable file 3:

| File Name (size) | Description |
| :--- | :--- |
| Wales_UKB_LU_ND.csv (9.08 MB) | Street network distance in metres of UK Biobank <br> participant's residence from specific destinations. |

### 4.2 Street network accessibility

spatial Design Network Analysis (sDNA) is a state-of-the-art technique of urban network analysis that have evolved from the conventional network analyses techniques like space syntax. Details on urban network analyses techniques employed in health research can be found elsewhere ${ }^{1,47}$. sDNA employs a technically improved network algorithm and has been developed by Cardiff University's School of Planning and Geography (http://www.cardiff.ac.uk/sdna). sDNA is able to overcome many of the inherent problems of conventional network analysis techniques, especially the representational problems and the modifiable link problem by its ability to function with off-theshelf street centreline data such as Ordnance Survey ITN data, with minimum preparation.

The Ordnance Survey Mastermap Integrated Transport Network (ITN) layer for Wales with a 10 mile buffer was extracted. The sDNA Prepare tool was employed for automated cleaning of the ITN layer including the initial processes of removal of traffic islands as well as repairing of split links. sDNA standardizes the network link as the fundamental unit of computation. By using such industrystandard link representation, sDNA overcomes the modifiable link unit problem, as well as provides a better physical interpretation of road centreline data. In an urban space, several socio-economic processes such as density of residences, jobs, traffic flows, pedestrian movements and so on have been known to be correlated with the density of street network links. sDNA offers the analyst a diverse choice of refined graphical indices of accessibility, thereby enabling analyses of network centrality (in terms of closeness and betweenness centrality), network detour (in terms of sum of crow flight, mean diversion ratio and diversion ratio), network shape and efficiency (in terms of convex hull area, perimeter and bearing, and network shape index), link characteristics (in terms of length, angular curvature and connectivity) and radius-based indices (in terms of number of links, total network length, total angular distance, total and mean geodesic length and number of junctions within a defined catchment radius $)^{48}$. Details of the twenty indices of physical street-level accessibility have been described in Table 4. sDNA provides the option of enumerating the centrality indices based on the notion of Euclidean or angular distance, with the choice of several weighting functions such as link weighting, link length weighting or other user-customized weighted indices. As in angular segment analysis, sDNA enumerates all the graphical accessibility indices within a specific user-defined catchment radius; nonetheless, sDNA provides the user with the option of discrete or continuous space analysis. In discrete space analysis, each link is considered as a discrete (whole) entity and, if a part of a link falls inside a given radius, the entire link is counted as being within the radius. On the other hand, in continuous space analysis, each link is treated as a continuous entity and only the fractional part of a link falling inside a given radius is counted, leading to fractional
(proportional) link counts. The former is computationally faster, while the latter produces more accurate results. This study has employed continuous analysis throughout. sDNA has been tested and has successfully reproduced results equivalent to or better than those of predecessor space syntax methods. SDNA is also innovative in its class in providing a workflow that is fully automated. The UK Ordnance Survey (OS) Topography Layer, AddressBase Premium and Integrated Transport Network Layer linkages are cross-referenced through unique identifiers; the OS supports Digital National Framework identifiers, which facilitates integration and sharing of spatial information from diverse sources.

All the sDNA measured indices of accessibility were calculated for all the street links within the boundaries of the study area (Wales with a 10 kilometre buffer). Analyses were done at several spatial scales to take in to account the influence of physical accessibility at micro (neighbourhood), meso (city) and macro (regional) levels. Nineteen different catchment radii were employed in the present study for analysis: 400, 800, 1200, 1500, 2000, 3000, 5000, 7500, 10000, 12500, 15000, $17500,20000,25000,30000,35000,40000,45000,50000$ metres. All the sDNA network metrics were subsequently linked to the dwelling location of the UK Biobank participant. Three types of linkages were used in the present study:

- Physical accessibility indices of the street network link closest to the UK Biobank respondent's dwelling location were linked together.
- Physical accessibility indices of the street network link within a 25 metres buffer of the UK Biobank respondent's dwelling location were linked together.
- Physical accessibility indices of the street network link within a 50 metres buffer of the UK Biobank respondent's dwelling location were linked together.

In the latter two cases mean, minimum, maximum and standard deviation in the accessibility indices of all the links within 25 and 50 metres of the UK Biobank respondent's dwelling location were enumerated.

Table 4: List of sDNA modelled street accessibility indices

| sDNA modelled street accessibility index (acronym used*) | Description | Spatial scale of measurement (catchment radius R in metres) |
| :---: | :---: | :---: |
| Link characteristics: <br> These measures describe the characteristics of individual links in the network and hence they are not network indices per se. |  |  |
| Link Connectivity (Link_Connectivity) | The number of link ends that an individual link is connected to at its end points. | Measured for each link in the network. |
| Link Length (Link_Length) | Length of the individual link in the network. | Measured for each link in the network. |
| Link Angular Curvature (Link_Ang_Curvature) | The cumulative angular change while traversing the full length of a link in degrees. | Measured for each link in the network. |
| Centrality analysis: <br> These set of measures owe their origin to the graph theory. The associations between urban morphology and the social phenomena dependent on it are essentially captured by indices of relationality in the graphs. The notion of accessibility captured by these measures acts to formally elucidate how network morphology influences individual activity behaviours and drives various socioeconomic processes. They indicate the centrality of a vertex within a graph. |  |  |
|  |  |  |
| Mean Angular Distance (Mean_Ang_Dist_WI_RXXXXXc) | In graphical terminology, also called as the closeness centrality/accessibility. It is an indicator of the degree of difficulty, on average, of navigating to all possible destinations within a specified radius from each given link. This is weighted by the link length. | $\begin{aligned} & 400,800,1200,1500, \\ & 2000,3000,5000, \\ & 7500,10000,12500, \\ & 15000,17500,20000, \\ & 25000,30000,35000, \\ & 40000,45000,50000 \end{aligned}$ |
| Network Quantity Penalized for Distance (NetQuantPD_Ang_WI_XXXXXC) | This is an improved measure of the conventional closeness centrality and takes in to account the effects of network quantity. For each link within a specified radius, it takes the network quantity (defined link length) and divides it by the difficulty of access (angular). This is weighted by the link length. | $\begin{aligned} & 400,800,1200,1500, \\ & 2000,3000,5000, \\ & 7500,10000,12500, \\ & 15000,17500,20000, \\ & 25000,30000,35000, \\ & 40000,45000,50000 \end{aligned}$ |
|  | In graphical terminology, also called | 400, 800, 1200, 1500, |

| Betweenness <br> (Betweenness_Ang_WI_RXXXXXc) | as the betweenness centrality or path overlap or through-movement potential. It is indicative of how often a given link is used for a journey within a defined radius. Measured as the sum of geodesics that pass through a link for a journey within a defined radius. This has been weighted by origin-destination link length. | $\begin{aligned} & 2000,3000,5000, \\ & 7500,10000,12500, \\ & 15000,17500,20000, \\ & 25000,30000,35000, \\ & 40000,45000,50000 \end{aligned}$ |
| :---: | :---: | :---: |
| Two Phase Betweenness <br> (TPBetweenness_Ang_WI_RXXXXXc) | This is betweenness weighted by a two-step floating catchment model. Measured as the sum of geodesics that pass through a link for a journey within a defined radius weighted by the proportion of network quantity accessible from geodesic origin that is represented by geodesic destination. | $\begin{aligned} & 400,800,1200,1500, \\ & 2000,3000,5000 \\ & 7500,10000,12500, \\ & 15000,17500,20000, \\ & 25000,30000,35000, \\ & 40000,45000,50000 \end{aligned}$ |
| Two Phase Destination assignment (TPDestination_Ang_WI_RXXXXXc) | This is the total flow to each destination under the two phase betweenness model. In other words, it is similar to the two phase betweenness, but measured for the destination of each geodesic only. | $\begin{aligned} & 400,800,1200,1500, \\ & 2000,3000,5000 \\ & 7500,10000,12500, \\ & 15000,17500,20000, \\ & 25000,30000,35000, \\ & 40000,45000,50000 \end{aligned}$ |
| Simple radial measures: <br> These measures pertain to the characteristics of the links within a specified network radius. |  |  |
| Links <br> (Links_RXXXXXC) | The number of network links within a specified network radius. | $\begin{aligned} & 400,800,1200,1500, \\ & 2000,3000,5000 \\ & 7500,10000,12500, \\ & 15000,17500,20000, \\ & 25000,30000,35000, \\ & 40000,45000,50000 \end{aligned}$ |
| Length <br> (Length_RXXXXXc) | The total network length within a specified network radius. | $\begin{aligned} & 400,800,1200,1500, \\ & 2000,3000,5000, \\ & 7500,10000,12500, \\ & 15000,17500,20000, \\ & 25000,30000,35000, \\ & 40000,45000,50000 \end{aligned}$ |
| Angular Distance (Ang_Dist_RXXXXXc) | Sum of angular distance of each individual link within a specified radius. | $\begin{aligned} & 400,800,1200,1500 \\ & 2000,3000,5000 \\ & 7500,10000,12500 \\ & 15000,17500,20000, \end{aligned}$ |

|  |  | $\begin{aligned} & 25000,30000,35000 \\ & 40000,45000,50000 \end{aligned}$ |
| :---: | :---: | :---: |
| Weight <br> (Weight_WI_RXXXXXC) | Total weight within a specified radius. Weights have been specified with respect unit of network length (in length weighted analysis). | $\begin{aligned} & 400,800,1200,1500 \\ & 2000,3000,5000 \\ & 7500,10000,12500, \\ & 15000,17500,20000, \\ & 25000,30000,35000, \\ & 40000,45000,50000 \end{aligned}$ |
| Mean Geometric Length <br> (MeanGeoLen_Ang_WI_RXXXXXc) | Mean of the angular geodesic Euclidean length within a specified radius. This has been weighted by the origin to destination link length. | $\begin{aligned} & 400,800,1200,1500 \\ & 2000,3000,5000 \\ & 7500,10000,12500, \\ & 15000,17500,20000, \\ & 25000,30000,35000, \\ & 40000,45000,50000 \end{aligned}$ |
| Network detour analysis: <br> Measure the network severance by comparing the hypothetical crow fly distance to actual network distance. It is an indicator of the extent of deviation of the network from the most direct path. |  |  |
| Mean Crow Flight Distance (Mean_Crow_Flight_WI_RXXXXXc) | Mean of the crow flight distance between a link and all the links within a defined radius. This is weighted by the link length. | $\begin{aligned} & 400,800,1200,1500 \\ & 2000,3000,5000 \\ & 7500,10000,12500 \\ & 15000,17500,20000 \\ & 25000,30000,35000 \\ & 40000,45000,50000 \end{aligned}$ |
| Diversion Ratio <br> (Diversion_Ratio_Ang_WI_RXXXXXc) | Mean of the ratio of actual geodesic length to the crow flight distance for all geodesics within a defined radius. This is weighted by the link length. Indicative of the degree of deviation of the actual paths from the crow flight path. | $\begin{aligned} & 400,800,1200,1500 \\ & 2000,3000,5000 \\ & 7500,10000,12500 \\ & 15000,17500,20000 \\ & 25000,30000,35000 \\ & 40000,45000,50000 \end{aligned}$ |
| Network shape: <br> Measure of network efficiency in terms of the spatial footprint of the street network in urban space. |  |  |
| Convex Hull Area (Convex_Hull_Area_RXXXXXC) | Area of the convex hull containing all the origins and destinations within a defined radius. It is an indicator of the network footprint or the spatial spread of the street network in the | 400, 800, 1200, 1500, 2000, 3000, 5000, 7500, 10000, 12500, 15000, 17500, 20000, 25000, 30000, 35000, |

|  | urban space. | 40000, 45000, 50000 |
| :---: | :---: | :---: |
| Convex Hull Perimeter (Convex_Hull_Perimeter_RXXXXXC) | Length of perimeter of the convex hull containing all the origins and destinations within a defined radius. | $\begin{aligned} & 400,800,1200,1500 \\ & 2000,3000,5000 \\ & 7500,10000,12500 \\ & 15000,17500,20000 \\ & 25000,30000,35000 \\ & 40000,45000,50000 \end{aligned}$ |
| Convex Hull Maximum Radius (Convex_Hull_Max_Radius_RXXXXXc) | Maximum radius of the convex hull measured as the crow flight distance from the centre of the origin link to the furthest point on the convex hull of a defined radius. | $\begin{aligned} & 400,800,1200,1500, \\ & 2000,3000,5000 \\ & 7500,10000,12500, \\ & 15000,17500,20000 \\ & 25000,30000,35000, \\ & 40000,45000,50000 \end{aligned}$ |
| Convex Hull Bearing (Convex_Hull_Bearing_RXXXXXC) | Compass bearing of the line of maximum radius of convex hull of a defined radius, measured in degrees. It indicates the direction in which one can travel furthest from the origin link, while staying inside the network radius. | $\begin{aligned} & 400,800,1200,1500 \\ & 2000,3000,5000 \\ & 7500,10000,12500 \\ & 15000,17500,20000, \\ & 25000,30000,35000, \\ & 40000,45000,50000 \end{aligned}$ |
| Convex Hull Shape Index (Convex_Hull_Shape_Index_RXXXXXC) | Measures the degree of uniformity of the network in all directions. It is measured as the square of the hull perimeter divided by $4 \Pi$ times the hull area. Ranges from 1 in case of a circle to higher values, with higher indicating non-uniformity across all directions. | $\begin{aligned} & 400,800,1200,1500 \\ & 2000,3000,5000 \\ & 7500,10000,12500 \\ & 15000,17500,20000 \\ & 25000,30000,35000 \\ & 40000,45000,50000 \end{aligned}$ |

* In each of the acronyms, the presence of:

WI - Indicates that the analyses is weighted by origin - destination link length,
$R X X X X X$ - Indicates the catchment radius at which the analysis was conducted; this can be R500 for radius of 500 metres or R50000 for radius of 50000 metres,
$c$ - Indicates continuous space analysis.

## Deliverable files 4a-4i:

| File Name (size) | Description |
| :--- | :--- |
| UKB_Wales_sDNA_closest_link.csv (72.1 MB) | Physical accessibility indices of the street network link <br> closest to the UK Biobank respondent's dwelling location. |
| UKB_Wales_sDNA_25m_mean.csv (66.8 MB) | Mean value of physical the accessibility indices of all the <br> links lying within 25 metres of the UK Biobank <br> respondent's dwelling location. |
| UKB_Wales_sDNA_25m_min.csv (66.4 MB) | Minimum value of physical the accessibility indices of all <br> the links lying within 25 metres of the UK Biobank <br> respondent's dwelling location. |
| UKB_Wales_sDNA_25m_max.csv (66.4 MB) | Maximum value of physical the accessibility indices of all <br> the links lying within 25 metres of the UK Biobank <br> respondent's dwelling location. |
| UKB_Wales_sDNA_25m_STD.csv (30.4 MB) | Standard deviation in physical the accessibility indices of all <br> the links lying within 25 metres of the UK Biobank <br> respondent's dwelling location. |
| UKB_Wales_sDNA_50m_mean.csv (72.4 MB) | Mean value of physical the accessibility indices of all the <br> links lying within 50 metres of the UK Biobank <br> respondent's dwelling location. |
| UKB_Wales_sDNA_50m_min.csv (72.1 MB) | Minimum value of physical the accessibility indices of all <br> the links lying within 50 metres of the UK Biobank <br> respondent's dwelling location. |
| UKB_Wales_sDNA_50m_max.csv (71.3 MB) | Maximum value of physical the accessibility indices of all <br> the links lying within 50 metres of the UK Biobank <br> respondent's dwelling location. |
| Standard deviation in physical the accessibility indices of all |  |
| the links lying within 50 metres of the UK Biobank |  |
| respondent's dwelling location. |  |

* For meaning of each acronym used in the variable column and their description, please see Table 3.

### 4.3 Greenness

Normalized Difference Vegetation Index (NDVI) has been employed as an objective measure of greenness. The NDVI is a unitless index calculated from the reflectance measures in satellite data, comparing the amount of energy absorbed by the chlorophyll in the red portion and the amount scattered by the internal structure of the leaves in the near-infrared region. This contrast has been employed as an estimate for vegetation greenness, as indicated by the following formula:

$$
N D V I=\frac{(N I R-R E D)}{(N I R+R E D)}
$$

where RED and NIR stand for the spectral reflectance measurements acquired in the visible (red) and near-infrared regions, respectively. The index ranges between -1 and +1 , with higher values reflective of healthy green vegetation and vice versa. A collection 0.50 metre resolution Colour Infrared (CIR) imagery data collected by Blue Sky were merged together, area of interest extracted and employed in the calculation of NDVI index in Raster Calculator - Spatial Analyst, ArcGIS 10.2. The CIR band 2, 630-690 nm, was used as the red region of the electromagnetic spectrum, while band 1, 760-900 nm, acted as the infrared region, so that the formulae used was NDVI = (Band $1-$ Band 2$) /$ (Band $1+$ Band 2). Neighbourhoods of 0.5 and 1.0 kilometre Euclidean buffers around each UK Biobank participant's residence were defined and the greenness was calculated in terms of mean, minimum, maximum and standard deviation in the NDVI values within the defined 0.5 and 1.0 kilometre circular buffers.

## Deliverable file 5:

| File Name (1.33 MB) | Description |
| :--- | :--- |
| Wales_UKB_NDVI.csv | Normalized Difference Vegetation Index greenness within <br> pre-defined Euclidean buffers (0.5 Km, 1.0 Km) of UK <br> Biobank participant's residence. |

Header file name: Wales_UKB_NDVI_Header.csv (172 bytes)

Table 6: Description of variables used

| Column No. | Variable | Description |
| :--- | :--- | :--- |
| 1 | Encoded <br> anonymised <br> participant ID |  |
| 2 | NDVI_500m_mean | Mean NDVI within 0.5 Km Euclidean buffer of UK Biobank <br> participant's residence |
| 3 | NDVI_500m_min | Minimum value of NDVI within 0.5 Km Euclidean buffer of UK <br> Biobank participant's residence |
| 4 | NDVI_500m_max | Maximum value of NDVI within 0.5 Km Euclidean buffer of UK <br> Biobank participant's residence |
| 5 | NDVI_500m_STD | Standard deviation in NDVI within 0.5 Km Euclidean buffer of <br> UK Biobank participant's residence |
| 6 | NDVI_1000m_mean | Mean NDVI within 1.0 Km Euclidean buffer of UK Biobank <br> participant's residence |
| 7 | NDVI_1000m_min | Minimum value of NDVI within 1.0 Km Euclidean buffer of UK <br> Biobank participant's residence |
| 8 | NDVI_1000m_max | Maximum value of NDVI within 1.0 Km Euclidean buffer of UK <br> Biobank participant's residence |
| 9 | NDVI_1000m_STD | Standard deviation in NDVI within 1.0 Km Euclidean buffer of <br> UK Biobank participant's residence |

### 4.4 Terrain (slope)

A series of 5 metre resolution Bluesky digital terrain model were mosaicked together and the area of interest extracted. Slope analysis was conducted in Spatial Analyst, ArcGIS 10.2. As in the case of greenness, neighbourhoods of 0.5 and 1.0 kilometre Euclidean buffers around each UK Biobank participant's residence were defined and slope (in degrees) within an individual's home range was operationalized in terms of mean, minimum, maximum and standard deviation in the values within the defined 0.5 and 1.0 kilometre circular buffers.

## Deliverable file 6:

| File Name (size) | Description |
| :--- | :--- |
| UKB_Wales_slope.csv (1.62 MB) | Terrain (slope in degrees) within pre-defined Euclidean <br> buffers (0.5 Km, 1.0 Km) of UK Biobank participant's <br> residence. |

Header file name: UKB_Wales_slope_Header.csv (188 bytes)

Table 7: Description of variables used

| Column No. | Variable | Description |
| :--- | :--- | :--- |
| 1 | Encoded anonymised <br> participant ID |  |
| 2 | Slope500m_Mean | Mean slope within 0.5 Km Euclidean buffer of UK Biobank <br> participant's residence |
| 3 | Slope500m_Minimum | Minimum value of slope within 0.5 Km Euclidean buffer of <br> UK Biobank participant's residence |
| 4 | Slope500m_Maximum | Maximum value of slope within 0.5 Km Euclidean buffer of <br> UK Biobank participant's residence |
| 5 | Slope1000m_Mean | Standard deviation in slope within 0.5 Km Euclidean buffer <br> of UK Biobank participant's residence |
| 6 | Mean slope within 1.0 Km Euclidean buffer of UK Biobank <br> participant's residence |  |
| 7 | Slope1000m_Minimum | Minimum value of slope within 1.0 Km Euclidean buffer of <br> UK Biobank participant's residence |
| 8 | Slope1000m_Maximum | Maximum value of slope within 1.0 Km Euclidean buffer of <br> UK Biobank participant's residence |
| 9 | Slope1000m_STD | Standard deviation in slope within 1.0 Km Euclidean buffer <br> of UK Biobank participant's residence |

### 4.5 Welsh index of multiple deprivation (area-level deprivation)

The Welsh index of multiple deprivation (WIMD) scores, measured at the level of lower super output areas (LSOA) census areas have been employed as indicators of neighbourhood deprivation. WIMD 2008 and 2011 have been employed in the present study. The composite WIMD score originates from eight unitless indicators of disadvantage (so-called domain indices) for income, employment, health, education, access to services, community safety, physical environment and housing having domain weights of $23.5 \%, 23.5 \%, 14 \%, 14 \%, 10 \%, 5 \%, 5 \%$ and $5 \%$ respectively ${ }^{49}$. Thus, each geocoded UK respondent's address was associated with the WIMD (2008 and 2011) scores of the LSOA in which it's spatially located.

Deliverable file 7:

| File Name (size) | Description |
| :--- | :--- |
| UKB_Wales_WIMD.csv (2.16 MB) | WIMD 2008 and 2011 scores of the LSOAs within which UK <br> Biobank participant resides. |

Header file name: UKB_Wales_WIMD_Header.csv (528 bytes)

Table 8: Description of variables used

| Column <br> No. | Variables | Description |
| :--- | :--- | :--- |
| 1 | Encoded anonymised participant ID |  |
| 2 | LSOA_2011_code | 2011 lower super output area code |
| 3 | LSOA_2011_name | 2011 lower super output area code |
| 4 | Income_2008_score | WIMD 2008 income domain |
| 5 | Employment_2008_score | WIMD 2008 employment domain |
| 6 | Health_2008_score | WIMD 2008 health domain |
| 7 | Education_2008_score | WIMD 2008 education domain |
| 8 | Access_to_services_2008_score | WIMD 2008 access to services domain |
| 9 | Housing_2008_score | WIMD 2008 housing domain |
| 10 | Physical_environment_2008_score | WIMD 2008 physical environment domain |
| 11 | Community_safety_2008_score | WIMD 2008 community safety domain |
| 12 | WIMD_2008_score | WIMD 2008 overall score |
| 13 | Income_2011_score | WIMD 2011 income domain |
| 14 | Employment_2011_score | WIMD 2011 employment domain |
| 15 | Health_2011_score | WIMD 2011 health domain |
| 16 | Education_2011_score | WIMD 2011 education domain |
| 17 | Access_to_services_2011_score | WIMD 2011 access to services domain |
| 18 | Housing_2011_score | WIMD 2011 housing domain |
| 19 | Physical_environment_2011_score | WIMD 2011 physical environment domain |
| 20 | Community_safety_2011_score | WIMD 2011 community safety domain |
| 21 | WIMD_2011_score | WIMD 2011 overall score |

### 4.6 Building class

The building class GIS datasets were extracted for the area of interest. The building footprints were subsequently linked with the geocoded UK Biobank participants' residences through a spatial query. After taking in to account the missing data, linkages could be obtained for $\mathrm{N}=15,470$ Biobank respondents. There are 9 age categories and 19 type categories in this dataset. However, age categories 1,2 and 8 as well as type categories of 3,5 and 15 have been removed from the latest release (indicated by DNU; see Fig. 1). The age and type codes are combined together to form the building class code of each dwelling.

## Deliverable file 8:

| File Name (size) | Description |
| :--- | :--- |
| Wales_UKB_Building_Class.csv (587 KB) | Building class of the dwelling within which UK Biobank <br> participant resides. |

Header file name: Wales_UKB_Building_Class_Header.csv (111 bytes)

Table 9: Building class quality code used ${ }^{50}$

| Class code | Definition |
| :---: | :---: |
| A | - Very experienced PI compiled the dataset <br> - The imagery used was 12.5 cm resolution or better <br> - The imagery was of very good or better quality with high definition of building features <br> - Field verification was undertaken with fieldwork photos available <br> - Some local knowledge was available or gained during the field visit. |
| B | - Experienced PI compiled the dataset <br> - The imagery used was 25 cm resolution or better <br> - The imagery was of good or better quality with reasonable definition of building features <br> - Field verification was undertaken <br> - Some local knowledge was available or gained during the field visit |
| C | - Less experienced PI compiled the dataset <br> - The imagery used was 50 cm resolution or better <br> - The imagery was often of a poor quality with poor definition of building features <br> - Only limited field verification was undertaken <br> - Little local knowledge was available or gained during the field visit. |
